

UX Design Activities Report

1. Solution Ideation

Known UX Problem: Booking an appointment in a hospital app is often confusing because users face too many steps, unclear doctor availability, and difficulty selecting time slots.

Crazy 8s / Brainwriting Ideas:

- One-click appointment booking with saved patient details.
- AI-based doctor recommendation depending on symptoms.
- Calendar view showing available appointment slots.
- Voice-assisted booking for elderly users.
- Emergency quick-book option for urgent consultation.
- Color-coded availability indicators.
- Reminder notifications through SMS and app alerts.
- Live waiting-time estimation.

Low-Fidelity Ideas:

- Simple login screen with large buttons.
- Doctor search page with filter options.
- Appointment slot grid layout.
- Confirmation screen with appointment summary.

2. Creating User Stories

- 1 As a patient, I want to quickly book appointments, so that I can save time.
- 2 As an elderly user, I want voice assistance, so that I can navigate the app easily.
- 3 As a working professional, I want appointment reminders, so that I do not miss my consultation.
- 4 As a parent, I want to book appointments for family members, so that I can manage healthcare efficiently.
- 5 As a new user, I want doctor recommendations, so that I can choose the right specialist.

3. Creating Scenarios

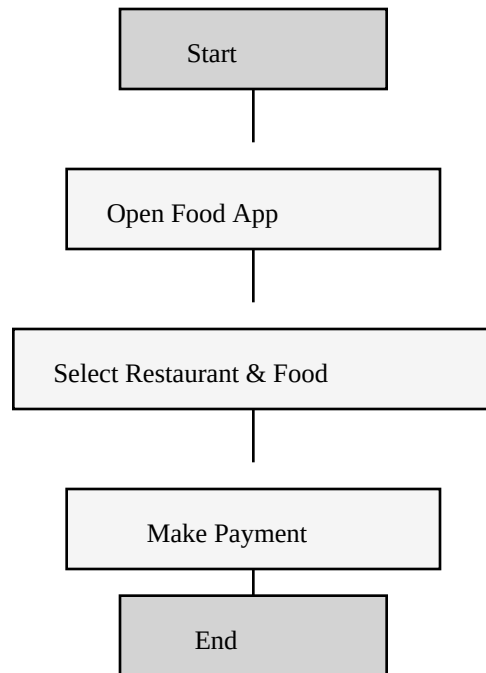

User Story Selected: As a working professional, I want appointment reminders, so that I do not miss my consultation.

Scenario:

Ravi is a 30-year-old software engineer working in a busy IT company. He often forgets personal appointments because of his hectic work schedule. One evening, Ravi feels unwell and books an appointment with a doctor using the hospital app while commuting home. The app immediately confirms the appointment and sends a reminder notification one day before and one hour before the consultation. Ravi feels relieved and confident because he knows the app will help him remember the appointment. He attends the consultation on time without stress.

4. Flow Diagram / Flow Mapping

Task: Ordering food through a mobile app.

5. Information Architecture (IA)

Example App: University Website

Card Sorting (Open Sorting):

Users grouped the content into the following categories:

- Admissions
- Academics
- Departments
- Student Services
- Examinations
- Placements
- Library
- Contact Information
